

Learning Log

Shazil Arif

February 6, 2020

The purpose of the learning log is to reflect upon your progress in learning the content of SE 2AA4/ CS 2ME3. This is a personal journal. The intention is for you to be aware of your progress by means of recording and reflecting. A template is provided for each week. You should fill in the question marks. You are also free to add your own subsections.

1 Week 1 Intro to Course

Dates

Jan 6 to Jan 10

Lecture 1 Introduction to Course

Discuss Course administrative details, marking scheme, material and content to be taught

Lecture 2 Software Engineering Profession

Discussed the differences between studying Computer Science and Software Engineering, History of Software Engineering and some important figures such as Parnas

Tutorial 1 Git, Doxygen and A1

Learnt how to install Doxygen, Tex, Git and set up necessary tools and development environment to complete assignments

Textbook Reading (Ghezzi, H&S or other)

I did not read the book this week

Assignment Progress

Finished the coding and testing portions

Midterm/Final Review Progress

Have not started

Reflection Relating Course Topics, Other Courses, Other Experiences

The discussion board is quite helpful. I find that this course really helps you understand deeply what "Software Engineering" really is. It focuses on the practical aspects of the profession rather than just programming.

2 Week 2 Software Qualities, Software Engineering Principles

Dates

Jan 13 to Jan 17

Lecture 3 Software Qualities

Discussed Software qualities such as correctness, robustness, reliability, portability, maintainability, etc.. Comparing and contrasting different terminology

Lecture 4 Software Engineering principles

Discussed key SE principles including abstraction, information hiding, designing for change, separation of concerns and more

Tutorial 2 Basics of Latex and PEP8 convention for Python

Learnt the basics of latex, syntax, different editors etc. Discussed the PEP8 standards

Textbook Reading (Ghezzi, H&S or other)

Have not started :-(

Assignment Progress

Nearly complete. missing a few tests for pos adt

Midterm/Final Review Progress

Have not started reviewing

Reflection Relating Course Topics, Other Courses, Other Experiences

It is nice to see many different software engineering principles, methods and practices being defined in detail and how to apply them

3 Week 3 Introduction to modules and Mathematics for MIS

Dates

Jan 20 to Jan 24

Lecture 5 Introduction to Modules

Important goals to keep in mind when developing software such as Design for change and Product families. Discussed The module interface, module implementation

Information Hiding: Basis for design Implementation secrets are hidden from clients Encapsulate changeable design decisions as implementation secrets within module implementations Encapsulate changeable design decisions as implementation secrets with module implementations

The WRONG ANS: HAS NOTHING TO DO WITH Security and HIDING DATA, VARIABLES

Important for midterm! internalize it

Discussed examples of modules such as record, library, abstract data type, generic modules Note: follow precise terminology from Ghezzi textbook

Difference between a library and module

Library: Has no state information or record of any stored data. E.g a Math library that has functions that take inputs and gives outputs

Module: Has state information and some record of data (a ADT module?)

When implementing a specification must match it, not look like it

Lecture 6 Mathematics for MIS

Worked through an example of balancing chemical equations to demonstrate how we can take a problem, describe it in mathematical terms and syntax and from there translate to an actual program/code

Lecture 7 Module Interface Specification

Worked through an example of defining an abstract data type for a circle

Note : MIS is not giving the implementation, it only defines the interface! e.g MIS may give a specification `isbalanced()` that returns whether an equation is balanced..But it is not specified how to achieve this, it is up to the developer to figure out the implementation!

An abstract object in programming terms is a module where there is only one instance/singleton pattern

Tutorial 3 Math Review

Reviewed mathematical operators, unary and binary operators and their precedences

Discussed what a set is: 1) Distinct elements (i.e no elements are repeated) 2) All elements are of the same type

Operations on sets: Union: essentially combine two sets Intersection: elements in both sets Set Difference: Take first set and remove any elements that are common with other set e.g if we have $S = \{1, 2\}$ and $T = \{2, 3, 4\}$ then we have $S - T = \{1\}$. 3 and 4 not included cuz not in both sets

Subset

Cartesian product: all possible pairs

A set can be described in two ways: set enumeration: List out all elements in a set

Set comprehension: $S = \{x : t \mid R : E\}$ This means S is a set where its elements are of type t and satisfy a property R and E is some defining expression for a set element e.g $S = \{x : \mathbb{N} \mid 1 \leq x < 5 : x^2\}$ then $S = \{1, 4, 9, 16\}$

Types: A set of values e.g a value of type integer belongs to the set $S = \{-1, -2, 0, 1, 2, \dots\}$

We can have custom types: Such as a PointT type which can be a tuple $(x : \mathbb{R}, y : \mathbb{R})$

Quantifiers (Shorthand for applying the same operator many times)

$(\forall x : X \rightarrow R : P)$ x is an element of type X R is a range (usually a boolean condition indicating which elements to include/consider) P - the values to apply the operator "*" to. * may be +, -, / etc. e.g $\sum_{i=1}^5 x_i^2$ means to sum up the square of the terms from 1 to 5 (including 1 but not 5)

Quantifiers for conjunction and disjunction for logical and, we use the universal quantifier forall, since "and"

for logical or, we use existential quantifier, exists since "or"

Textbook Reading (Ghezzi, H&S or other)

Did not read

Assignment Progress

Complete

Midterm/Final Review Progress

Reviewing principles

Reflection Relating Course Topics, Other Courses, Other Experiences

Discussing modular design and information hiding tied in with what is currently being taught in our 2XB3 course, modular design and object oriented programming with Java. The overlapping material helps build a deeper understanding!

The Math review helps tie in with other courses such as Discrete Mathematics (2FA3). It is very interesting to see how to take a high level specification given in mathematical terminology and syntax and actually translating it to a program.

4 Week 4 Abstract Data Types

Dates

Jan 27 to Jan 31

Lecture 8 Implementing ADT's in Python

H and S notation $s[0 : 0]$ includes the upper bound. Python notation $s[0 : n]$ goes up to $n - 1$

Looked at different examples of implementations of ADT's such as a (x,y) point, a line ADT

A mutator function will have a transition state (since they modify the state)

can use x,y,z point in 3d space to define latitude longitude positions, and use complex math to transform it into 2d coords

@staticmethod?

Implementation and specification are very different! Keep this in mind
Abstract object: Singleton, Abstract data type: Instantiable, can have multiple copies

Lecture 9 More on ADT's and Assignment Discussion

Reviewed the difference between an abstract object and abstract data type.

Difference between a reference and actual value. Aliasing and pointers.

Generic Modules. What if we want a stack module for booleans, integers, stacks, strings?...

A state invariant is a proposition/expression that always evaluate to true. the state variable may change but the invariant holds true. Example for a generic stack module the invariant is $size \leq MAXSIZE$.

Module state machine

Lecture 10 A2 discussion and Classes, Interfaces in Python, UML

Discussed Assignment 2 details and how to work with classes, interfaces and inherited classes in python.

UML.

Difference between type and a class. Types are known at compile time Class of an object may only be known at run time

Tutorial 4 Mathematical notation, MIS

Discussed the MIS.

Worked through last years Assignment 2 to aid in our assignment and translating MIS specification to code.

Textbook Reading (Ghezzi, H&S or other)

Did not read

Assignment Progress

Finished Assignment 1 + report. Started working on Assignment 2

Midterm/Final Review Progress

Did not review

Reflection Relating Course Topics, Other Courses, Other Experiences

Not much to comment, understood what a invariant is which tied in with discrete mathematics concepts also understood a bit of referencing/aliasing in python and pointers which tied in with the C programming course.

5 Week 5 Functional Programming and More Abstraction, MIS stuff

Dates

Feb 3 to Feb 7

Lecture 11 Functional programming in Python

More on UML, MIS, interfaces and abstraction.

Discussed more about generic types, answered some MC questions Discussed some functional programming, same some live code examples of functional programming in python

Lecture 12 ?

Did not attend

Lecture 13 Modules with External Interaction

reduce and lambda (anonymous functions) in Python

Tutorial 5 Unit testing in python with pytest

Blackbox vs whitebox testing.

Unit testing allows to identifying bugs in code

pytest

all tests are in a class
each test has its own method
setup method(self,method):
do something before every test. e.g. define some state variables
teardown method(self,method)
do something after every test e.g.reset state variables
assert pytest.approx pytest.raise(exception name)

Have acceptable code coverage
